Clinical Policy: Cardiac Biomarker Testing
Reference Number: PA.CP.MP.156
Effective Date: 05/18
Last Review Date: 03/19

Description
The release of cardiac biomarkers is among the cascade of events that occur during acute coronary syndromes and cardiac ischemia. This policy discusses the medical necessity requirements for testing of these cardiac biomarkers.

Policy/Criteria
I. It is the policy of PHW that troponin I or T testing is medically necessary and the appropriate cardiac biomarker for evaluating for suspected acute myocardial infarctions (AMI).

II. It is the policy of PHW that creatine kinase myocardial isoenzyme (CK-MB) and myoglobin testing are not medically necessary in the evaluation for suspected AMI because troponin is the recommended biomarker due to its superior sensitivity and accuracy.

Background
Detection of specific cardiac biomarkers in blood serum is a useful clinical indication of AMI, myocarditis, or heart failure. According to the 2014 clinical practice guideline of the American College of Cardiologists / American Heart Association, (ACC/AHA) cardiac troponins have become the main biomarkers used for the diagnoses of acute coronary syndromes, specifically troponins I and T because these subunits are expressed in the myocardium.\(^1\)\(^,\)\(^2\) Furthermore, troponin levels are also elevated for acute and chronic decompensated heart failure in instances of myocyte injury and/or necrosis.\(^3\)

Other cardiac peptides that were previously assessed for AMI include CK-MB and myoglobin. However, recent evidence suggests that the sensitivity and specificity of these biomarkers are inferior compared to the troponins, suggesting that troponins are a more accurate biomarker of myocardial injury.\(^1\)\(^,\)\(^2\) According to the 2014 ACC/AHA clinical practice guideline, CK-MB and myoglobin are no longer necessary for acute coronary syndrome diagnosis as a result of the advent of troponin assays.\(^1\) CK-MB detection is comparatively less sensitive and less specific. Voltz et al. performed a retrospective cohort study across 55,000 emergency department visits for AMI and examined their CK-MB and troponin levels with screenings; the authors concluded that CK-MB can be omitted during the initial screening of AMIs.\(^6\) Eggers et al, evaluated the role of myoglobin with troponin I to detect AMI in a sample of 197 patients and determined that neither myoglobin nor CK-MB added clinical diagnostic value.\(^4\) Aviles et al analyzed AMI amongst patients with elevated cardiac troponins in a prospective cohort and noted that at least 20% of patients had normal CK-MB levels, thereby further questioning the validity of CK-MB as a valuable cardiac biomarker.\(^7\) Of note, Singh et al. measured CK-MB testing from 2007 to 2013 and found a dramatic decrease from 12,057 tests in 2007 to 36 tests in 2013.\(^5\)

Coding Implications
This clinical policy references Current Procedural Terminology (CPT®). CPT® is a registered trademark of the American Medical Association. All CPT codes and descriptions are copyrighted 2019, American Medical Association. All rights reserved. CPT codes and CPT descriptions are from the current manuals and those included herein are not intended to be all-inclusive and are included for informational purposes only. Codes referenced in this clinical policy are for informational purposes only. Inclusion or exclusion of any codes does not guarantee coverage. Providers should reference the most up-to-date sources of professional coding guidance prior to the submission of claims for reimbursement of covered services.
