## Clinical Policy: Mecasermin (Increlex)

Reference Number: PA.CP.PHAR.150

Effective Date: 01/2018

Last Review Date: 07/2022

[Coding Implications](#)[Revision Log](#)

### Description

Mecasermin (Increlex<sup>®</sup>) is a human insulin-like growth factor-1 (IGF-1).

### FDA Approved Indication(s)

Increlex is indicated for the treatment of growth failure (GF) in pediatric patients 2 years of age and older with:

- Severe primary IGF-1 deficiency (IGFD)  
*IGFD is defined by: height standard deviation score  $\leq -3.0$  and basal IGF-1 standard deviation score  $\leq -3.0$  and normal or elevated growth hormone (GH).*
- Growth hormone (GH) gene deletion who have developed neutralizing antibodies to GH

Limitation(s) of use:

- Increlex is not a substitute to GH for approved GH indications.
- Increlex is not indicated for use in patients with secondary forms of IGFD, such as GH deficiency, malnutrition, hypothyroidism, or chronic treatment with pharmacologic doses of anti-inflammatory corticosteroids.

### Policy/Criteria

It is the policy of PA Health & Wellness that Increlex is **medically necessary** when the following criteria are met:

#### I. Initial Approval Criteria

##### A. Severe Primary IGF-1 Deficiency (must meet all):

1. Diagnosis of severe primary IGF-1 deficiency (IGFD) (i.e., inherited growth hormone insensitivity [GHI])
2. Prescribed by in consultation with a pediatric endocrinologist;
3. Age  $\geq 2$  and  $< 18$  years;
4. If age  $> 10$  years, open epiphysis on x-ray;
5. IGF-1 serum level is  $\geq 3$  standard deviations (SD) below the mean;
6. GH serum level is normal or elevated;
7. Height is  $\geq 3$  SD below the mean for age and sex (SD, height, date, and age in months within the last 90 days are required);
8. Member does not have malignant neoplasia or a history of malignancy;
9. Somatropin (recombinant human GH) is not prescribed concurrently with Increlex;
10. Dose does not exceed 0.12 mg/kg twice daily.

**Approval duration:** 12 months or up to age 18, whichever is shorter

##### B. Acquired Growth Hormone Insensitivity (must meet all):

1. Diagnosis of acquired GH insensitivity;
2. Prescribed by or in consultation with a pediatric endocrinologist;
3. Age  $\geq 2$  and  $< 18$  years;

4. If age > 10 years, open epiphysis on x-ray;
  5. Documentation of genetic GH deficiency due to a GH gene deletion;
  6. Documentation of neutralizing GH antibodies;
  7. Member meets (a or b):
    - a. Short stature (SS): height is > 2 SD below the mean for age and sex (SD, height, date, and age in months within the last 90 days are required);
    - b. GF: one of the following (i, ii, or iii):
      - i. Height deceleration across two growth chart percentiles representing > 1 SD below the mean for age and sex (SD and 2 heights, dates, and ages in months at least 6 months apart within the last year are required);
      - ii. Growth velocity > 2 SD below the mean for age and sex over 1 year (SD and 2 heights, dates, and ages in months at least 1 year apart within the last year are required);
      - iii. Growth velocity > 1.5 SD below the mean for age and sex sustained over 2 years (SD and 2 heights, dates, and ages in months at least 2 years apart within the last two years are required);
  8. Member does not have malignant neoplasia or a history of malignancy;
  9. Somatropin (recombinant human GH) is not prescribed concurrently with Increlex;
  10. Dose does not exceed 0.12 mg per kg twice daily.
- Approval duration:** 6 months or up to age 18, whichever is shorter

**C. Other diagnoses/indications:** Refer to PA.CP.PMN.53

## **II. Continued Approval**

### **A. All Indications** (must meet all):

1. Currently receiving medication via PA Health & Wellness benefit or member has previously met all initial approval criteria or the Continuity of Care policy (PA.LTSS.PHAR.01) applies;
2. If member has received treatment for  $\geq 1$  year, height has increased  $\geq 2$  cm in the last year as documented by 2 height measurements taken no more than 1 year apart (dates and height measurements are required);
3. Member does not have malignant neoplasia or a history of malignancy;
4. Somatropin (recombinant human GH) is not prescribed concurrently with Increlex;
5. If request is for a dose increase, new dose does not exceed 0.12 mg per kg twice daily.

**Approval duration:** 12 months or up to age 18, whichever is shorter

### **B. Other diagnoses/indications** (must meet 1 or 2):

1. Currently receiving medication via PA Health & Wellness benefit and documentation supports positive response to therapy or the Continuity of Care policy (PA.LTSS.PHAR.01) applies; or
2. Refer to PA.CP.PMN.53

## **III. Appendices/General Information**

*Appendix A: Abbreviation/Acronym Key*

FDA: Food and Drug Administration

GH: growth hormone

IGF-1: insulin-like growth factor -1  
IGFD: insulin-like growth factor  
deficiency

SD: standard deviation

*Appendix B: Therapeutic Alternatives*

Not applicable

*Appendix C: Contraindications/Boxed Warnings*

- Contraindication(s):
  - In pediatric patients with malignant neoplasia or a history of malignancy. Therapy should be discontinued if evidence of malignancy develops
  - Known hypersensitivity to mecasermin
  - Intravenous administration
  - In patients with closed epiphyses for growth promotion
- Boxed warning(s): none reported

*Appendix D: Primary IGF-1 Deficiency\**

- Causes:
    - GH receptor mutations (known as Laron syndrome or the classical model of GH insufficiency)
    - Post-GH receptor mechanisms
      - GH receptor signal transduction
      - IGF-I gene mutations
      - Impaired IGF-1 promoter function
      - Defective stabilization of circulating IGF-I
    - IGF-1 receptor mutations
- Unlike the causes above, IGF-1 levels are normal or elevated in the case of IGF-1 receptor mutations which would render mecasermin therapy ineffective.*

---

*\*GH production and secretion is normal or above normal; therefore, exogenous GH treatment would be ineffective.*

*Appendix E: General Information*

- Severe Primary IGFD includes patients with mutations in the growth hormone receptor (GHR), post-GHR signaling pathway, and IGF-1 gene defects; they are not GH deficient, and therefore, they cannot be expected to respond adequately to exogenous GH treatment.
- Increlex is not intended for use in subjects with secondary forms of IGF-1 deficiency, such as GH deficiency, malnutrition, hypothyroidism, or chronic treatment with pharmacologic doses of anti-inflammatory steroids. Thyroid and nutritional deficiencies should be corrected before initiating treatment.
- Increlex is not a substitute for GH treatment.
- Failure to increase height velocity during the first year of therapy by at least 2 cm/year suggests the need for assessment of compliance and evaluation of other causes of growth failure, such as hypothyroidism, under-nutrition, and advanced bone age.

**IV. Dosage and Administration**

Indication	Dosing Regimen	Maximum Dose
Growth failure in children with severe primary IGFD or with GH gene deletion who have developed neutralizing antibodies to GH	Initial dose: 0.04 mg/kg to 0.08 mg/kg (40 mcg/kg to 80 mcg/kg) SC BID.  Dose may be increased by 0.04 mg/kg (40 mcg/kg) per dose up to 0.12 mg/kg (120 mcg/kg) SC BID	0.12 mg/kg per dose

## V. Product Availability

Multi-dose vial: 40 mg/4 mL (10mg/mL)
